## Syntax

- Computing the mean of any numerical array:

```
### Pure Python ###
mean = sum(array) / len(array)

### Using numpy ###
from numpy import mean
mean_numpy = mean(array)
```

- Computing the mean of a `Series` :

```
mean = Series.mean()
```

## Concepts

- We can summarize the distribution of a numerical variable by computing its **mean**.
- The mean is a single value and is the result of taking into account **equally** each value in the distribution.
- The mean is **the balance point** of a distribution — the total distance of the values below the mean is equal to the total distance of the values above the mean.
- The mean of a population can be defined algebraically in several equivalent ways:

\_\_\_\_\_

- The mean of a sample can be defined algebraically in several equivalent ways:

\_\_\_\_\_

- The sample mean  $\bar{x}$  is an unbiased estimator for the population mean  $\mu$ .
